

API.js

This component contains a set of functions for making HTTP requests to the Airtable API using the Axios library. It requires the Axios library to be installed and the Airtable Base ID and API Key to be available as environment variables.

The functions included are:

- `requestGetTodo`: retrieves all records from the specified Airtable table.
- `requestAddTodo`: adds a new record to the specified Airtable table.
- `requestDeleteTodo`: deletes a record from the specified Airtable table using its ID.
- `requestEditTodo`: updates a record in the specified Airtable table using its ID.
- `requestSortData`: retrieves all records from the specified Airtable table and sorts them according to the specified direction.
- `requestEditDescription`: updates the Description field of a record in the specified Airtable table using its ID.
- `requestEditCheck`: updates the Checkbox field of a record in the specified Airtable table using its ID.

Each function makes a request to the Airtable API using the Axios library and returns the response data. If an error occurs, it will be logged to the console and re-thrown.
